It's time to talk about

IBS-D MULTISYMPTOM RELIEF

for adult patients[1-3]

Short-term therapy

2 weeks of treatment for up to 6 months of relief of abdominal pain and diarrhea[1-3,*]

Median of 10 weeks (range of 6 to 24 weeks).

Patients who experience recurrence can be retreated up to 2 times.

*See TARGET 1, 2, and 3 study data sections.

#1 prescribed medication approved for IBS-D[4,†]

Actor portrayals

IBS-D, irritable bowel syndrome with diarrhea.

†Based on aggregated total of all prescribers as of August 2024.[4]

INDICATION

XIFAXAN® (rifaximin) 550 mg tablets are indicated for the treatment of irritable bowel syndrome with diarrhea (IBS-D) in adults.

IMPORTANT SAFETY INFORMATION

- **XIFAXAN is contraindicated in patients with a hypersensitivity to rifaximin, rifamycin antimicrobial agents, or any of the components in XIFAXAN. Hypersensitivity reactions have included exfoliative dermatitis, angioneurotic edema, and anaphylaxis.**

Please see additional Important Safety Information throughout and click here for full Prescribing Information.

Encourage your patients to take the time to talk about their IBS-D symptoms

IBS-D can be diagnosed in adults based on symptoms alone[5-7]

Evaluate patient history based on Rome IV criteria for IBS-D

- Abdominal pain at least 1 day per week for the past 3 months* associated with 2 or more of the following
  - Defecation
  - Change in stool frequency
  - Change in stool form
- Use the 25% Rule:
  <25% hard, lumpy stool,
  >25% loose, watery stool

Exclude alarm features

- Symptom onset after age 50
- Severe or worsening symptoms
- Weight loss
- Nocturnal diarrhea
- Rectal bleeding
- Iron-deficiency anemia
- Family history of colorectal cancer, celiac disease, IBD

Use physical exam and limited diagnostic testing

In diagnosed patients, **97.1%** **were accurately diagnosed with IBS using symptom-based criteria[8,†]**

Interpreting Rome IV for providers[9]

In 2021, the Rome Foundation proposed modified criteria for application of the Rome IV diagnostic criteria to the clinical practice setting. The intent was to allow clinicians to make a diagnosis and reduce unnecessary diagnostic testing. These criteria do not replace the standard Rome IV criteria for clinical trials or epidemiologic or pathophysiologic studies.[‡]

Nature of symptoms

The qualitative features of the Rome IV criteria must be met.

Bothersomeness

Patients should have sufficiently bothersome symptoms to seek care or affect daily activity.

Frequency

A frequency lower than the Rome IV threshold is permitted, provided that the symptoms are bothersome enough to interfere with daily activity or require treatment.

Duration

To provide some assurance that other diagnoses have been excluded, symptoms should be present for the previous 8 weeks.[§] The Rome IV requirement of a 3-month duration* of symptoms is not required.

IBD, inflammatory bowel disease; IBS, irritable bowel syndrome.

*With symptom onset at least 6 months prior to diagnosis.[5]

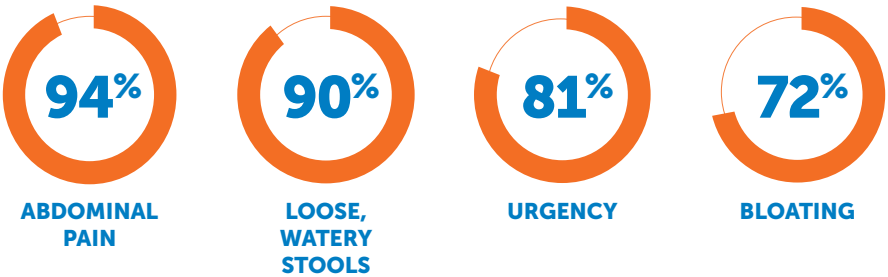
[†]Population sample of 5931 adults using Rome IV Diagnostic Questionnaires.[8]

[‡]Further research is needed to validate these recommendations.

[§]Exceptions are when a clinician needs to make an earlier diagnosis and is satisfied that the medical evaluation excludes other disease or for diagnoses where the symptoms occur infrequently and intermittently.[9]

>70% of patients diagnosed with IBS-D experienced multiple symptoms[10,*]

2015 AGA "IBS in America" Online Survey (n=1001):
The most common symptoms reported in patients with IBS-D included



Multiple symptoms experienced during the past 12 months*

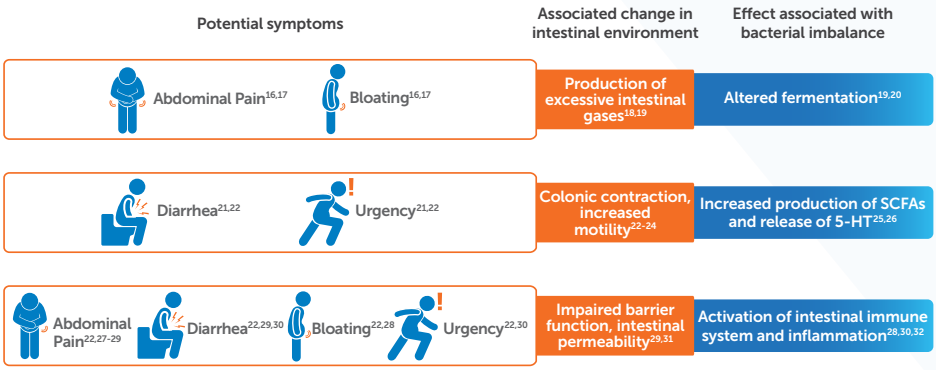
Percentage of patients with IBS-D who responded experiencing these symptoms.

*Data from the "IBS in America" online survey conducted September 14, 2015, through October 29, 2015, for the American Gastroenterological Association (AGA) by GfK Public Affairs & Corporate Communications with financial support from Ironwood Pharmaceuticals, Inc. and Allergan plc. Respondents with an IBS-D diagnosis (n=1001) and respondents with undiagnosed IBS-D (n=586) were asked the following question about a list of symptoms: "Which of the following symptoms have you experienced during the past 12 months?" Data shown reflect the responses of those with an IBS-D diagnosis. These symptoms are not inclusive of all the IBS-D symptoms reported within the survey and treatment was not assessed.

Studies show that many patients with IBS-D have a bacterial imbalance[11-13]

In a US clinical trial, the majority of patients with IBS-D had an abnormal composition of bacteria in the gut[14,*]

Bacterial imbalance has been linked to multiple symptoms of IBS-D[2,11,15]



Additional studies are needed to further clarify the role of gut microbiota in IBS.

XIFAXAN is believed to affect an underlying factor of IBS-D by directly attacking bacteria in the gut that may be linked to IBS-D symptoms[1,11,14,33-35]

- Blocks one of the steps in the transcription of bacterial DNA to RNA
- Inhibits bacterial protein synthesis
- Inhibits bacterial growth

Mechanism of action is unknown and does not imply clinical efficacy

XIFAXAN is the only FDA-approved, nonsystemic IBS-D treatment that alters the microbiome[1,14]

- **Less than 0.4% is absorbed from the GI tract**
- **There is an increased systemic exposure in patients with severe hepatic impairment; caution should be exercised when administering XIFAXAN to these patients**

5-HT, serotonin; SCFA, short-chain fatty acids.

*Data from 93 patients with IBS-D in a prospective TARGET 3 substudy that used lactulose breath testing to predict response to XIFAXAN.[14]

IMPORTANT SAFETY INFORMATION *(continued)*

- *Clostridium difficile*-associated diarrhea (CDAD) has been reported with use of nearly all antibacterial agents, including XIFAXAN, and may range in severity from mild diarrhea to fatal colitis. If CDAD is suspected or confirmed, ongoing antibiotic use not directed against *C. difficile* may need to be discontinued.

XIFAXAN
STRONG RECOMMENDATION
2020 ACG Guidelines

Now is a good time to talk about treatment

XIFAXAN was given a strong recommendation* to treat global IBS-D symptoms[5]

In the 2020 American College of Gastroenterology (ACG) Clinical Guideline on Managing IBS[5,†]

†Based on a moderate quality of evidence.‡

*Strength of recommendation: Strong=Most patients should receive the recommended course of action. Conditional=Many patients should have this recommended course of action, but different choices may be appropriate for some patients

‡Summary of quality of evidence: High=The estimate of effect is unlikely to change with new data. Moderate=The estimate of effect is uncertain.[5]

IMPORTANT SAFETY INFORMATION *(continued)*

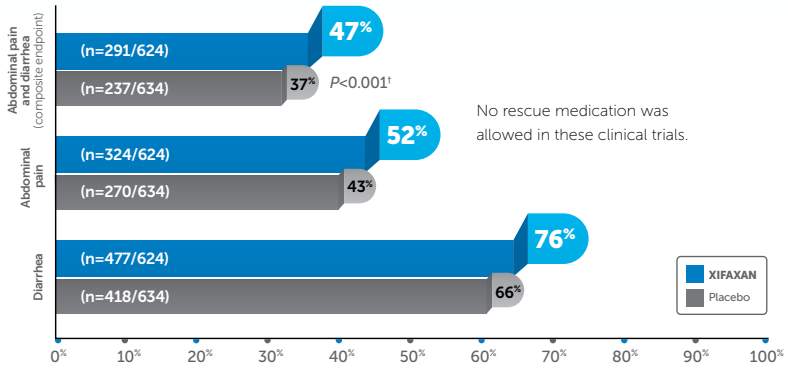
- There is an increased systemic exposure in patients with severe (Child-Pugh Class C) hepatic impairment. Caution should be exercised when administering XIFAXAN to these patients.

Please see additional Important Safety Information throughout and click here for full Prescribing Information.

In adults with IBS-D

2 weeks of XIFAXAN provided significant relief of abdominal pain and diarrhea[1,2,*]

Percentage of composite efficacy responders in TARGET 1 and 2 during the month following 2 weeks of treatment (pooled analysis)



Efficacy responder rates in TARGET trials 1 and 2 during the month following 2 weeks of treatment

TARGET 1 and 2 study design

Two identical phase 3, randomized, double-blind, placebo-controlled trials were conducted over a 3-month period. A total of 1258 patients meeting Rome II criteria for IBS-D were to receive XIFAXAN 550 mg 3 times a day (n=624) or placebo (n=634) for 14 days.

Primary endpoint: Adequate relief of IBS-D signs and symptoms for at least 2 of 4 weeks during the month following 14 days of treatment, with adequate relief defined as a response of "yes" to the weekly Subject Global Assessment (SGA) question: "In regards to your IBS-D symptoms, compared to the way you felt before you started study medication, have you, in the past 7 days, had adequate relief of your IBS-D symptoms? [Yes/No]."

Primary endpoint results: 41% of patients (254 of 624) in the XIFAXAN 550 mg group in both studies, 31% of TARGET 1 placebo group (98 of 314), and 32% of TARGET 2 placebo group (103 of 320) experienced adequate relief of IBS-D signs and symptoms.

Secondary endpoint: In both studies, more patients in the XIFAXAN 550 mg group had adequate relief of global IBS-D symptoms (see primary endpoint for definition) within the first month compared with the placebo group. Relief continued during the first 2 months and throughout all 3 months in both studies. TARGET 1 odds ratio: 1.35 (95% CI, 1.00-1.82). TARGET 2 odds ratio: 1.52 (95% CI, 1.13-2.03).

Composite endpoint: Responder defined by a ≥30% decrease from baseline in abdominal pain, with a weekly mean stool consistency score of <4 (loose stool) for ≥2 weeks during the month following 2 weeks of treatment.

*Patients who experience recurrence can be retreated up to 2 times.[1]

†*P*<0.001, represents pooled data.

IMPORTANT SAFETY INFORMATION *(continued)*

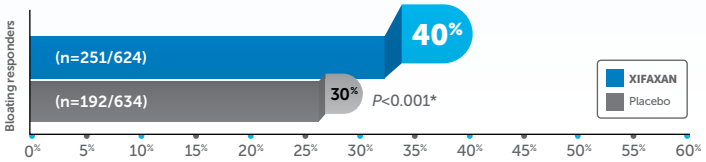
- Caution should be exercised when concomitant use of XIFAXAN and P-glycoprotein (P-gp) and/or OATPs inhibitors is needed. Concomitant administration of cyclosporine, an inhibitor of P-gp and OATPs, significantly increased the systemic exposure of rifaximin. In patients with hepatic impairment, a potential additive effect of reduced metabolism and concomitant P-gp inhibitors may further increase the systemic exposure to rifaximin.

Please see additional Important Safety Information throughout and click here for full Prescribing Information.

There's never a bad time to talk about relief

XIFAXAN provided relief of bloating and urgency[2,36]

Percentage of BLOATING responders based on weekly responses in TARGET 1 and 2[2]



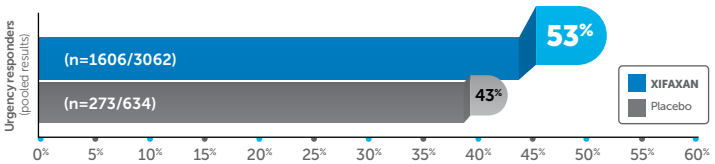
*Represents pooled analysis.

Key secondary endpoint: The proportion of patients who achieved adequate relief of IBS-D–related bloating (ie, responders) for at least 2 of 4 weeks during the month following 14 days of treatment.[2]

A bloating responder was defined as a patient who responded "yes" to the weekly question: "In regards to your IBS-D symptom of bloating, compared to the way you felt before you started study medication, have you, in the past 7 days, had adequate relief of your IBS-D symptom of bloating? [Yes/No]."[2,†]

†Responses were given during the first 4 weeks of the treatment-free period following 2 weeks of active treatment (primary evaluation period).[2]

Percentage of URGENCY responders based on weekly responses in TARGET 1, 2, and 3 in a pooled post hoc analysis[37]



Post hoc endpoint: Change from baseline to each week during the 12-week study duration for sense of urgency.[37]

An urgency responder was defined as a patient with a ≥30% decrease from baseline in the percentage of days with urgency for at least 2 of 4 weeks during the month following 14 days of treatment. Urgency was determined based on patient response of "yes" to the daily question: "Have you felt or experienced a sense of urgency today? [Yes/No]."[38]

Stool frequency (number of bowel movements per day) was assessed as a secondary endpoint, but there was no meaningful difference between XIFAXAN and placebo.[39,40]

IMPORTANT SAFETY INFORMATION *(continued)*

- In clinical studies, the most common adverse reactions for XIFAXAN in IBS-D (≥2%) were nausea (3%) and ALT increased (2%).
- INR changes have been reported in patients receiving rifaximin and warfarin concomitantly. Monitor INR and prothrombin time. Dose adjustment of warfarin may be required.

Let's talk about

Efficacy and safety evaluation of TARGET 3: an extended retreatment trial[1,3]

Open-label phase
(N=2438)

44% **XIFAXAN 1st treatment responders**
(n=1074/2438)

36% of open-label responders (n=382/1074) had no reported symptom recurrence within 6 months

36% of open-label responders did not experience relapse during the 18-week observation phase before being withdrawn from the trial for any reason

Symptom recurrence 64%
(n=692/1074)

10 weeks
Median time to recurrence during treatment-free observation
(range of 6 to 24 weeks)

Double-blind repeat treatment
(n=636 randomized)

Primary endpoint
38% experienced significant improvement in stool consistency and abdominal pain
(n=125/328, *P*<0.05 vs **31.5% for placebo, n=97/308**)

TARGET 3 study design

This trial included an open-label phase followed by a randomized, placebo-controlled phase, with the aim of determining the efficacy and safety of repeat treatment with XIFAXAN in patients with IBS-D who had responded to a 2-week course of XIFAXAN and subsequently experienced IBS-D symptom recurrence.

A responder was defined as a patient experiencing a ≥30% improvement from baseline in the weekly average abdominal pain score (based on daily self-reports) and a ≥50% reduction in the number of days in a week with a daily stool consistency of Bristol Stool Form Scale type 6 or 7 (mushy or watery) for ≥2 of the 4 weeks after treatment.

Recurrence was defined as the return of abdominal pain or lack of stool consistency for 3 weeks of a rolling 4-week period.

Primary endpoint: **The proportion of patients who were responders to repeat treatment in both IBS-D–related abdominal pain and stool consistency during the 4 weeks following the first repeat treatment course.**

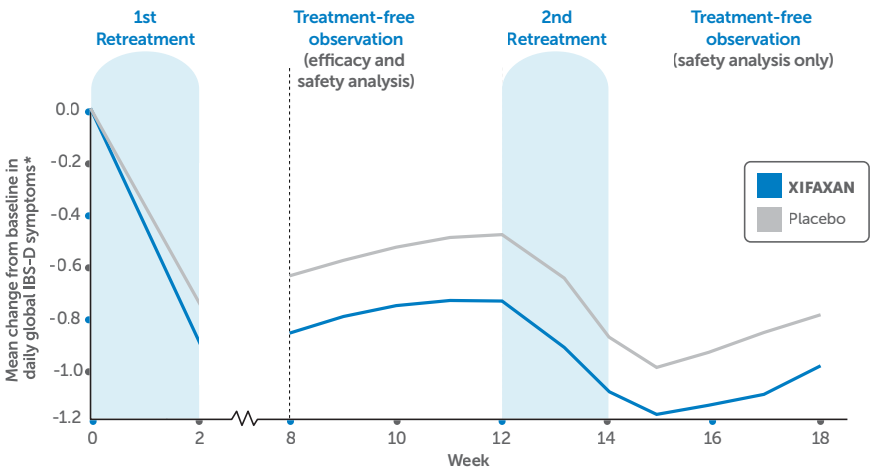
IMPORTANT SAFETY INFORMATION ***(continued)***

- XIFAXAN may cause fetal harm. Advise pregnant women of the potential risk to a fetus.

Please see additional Important Safety Information throughout and click here for full Prescribing Information.

Why not explore the route to relief?

With repeated treatment, recurring symptoms were less severe than baseline[1,3,*]



Change from baseline in mean daily global IBS-D symptom score during the first and second repeat treatment double-blind phases. Global daily IBS-D symptom score is based on a 6-question patient assessment related to bowel movements, urgency, abdominal pain, bloating, and severity of symptoms. All patients in the XIFAXAN arm of this study were given second retreatment/third treatment regardless of symptom recurrence status.[3]

*Baseline defined as study entry into open-label phase.[3]

IMPORTANT SAFETY INFORMATION

- XIFAXAN is contraindicated in patients with a hypersensitivity to rifaximin, rifamycin antimicrobial agents, or any of the components in XIFAXAN. Hypersensitivity reactions have included exfoliative dermatitis, angioneurotic edema, and anaphylaxis.

Please see additional Important Safety Information throughout and click here for full Prescribing Information.

In adults with IBS-D

XIFAXAN has a well-established safety profile[1]

Side effects at rates similar to placebo

	TARGET 1 and 2		TARGET 3	
Adverse event	XIFAXAN (n=624)	Placebo (n=634)	XIFAXAN (n=328)	Placebo (n=308)
Nausea	3%	2%	2%	1%
ALT increased*	NA	NA	2%	1%

- Constipation was observed in 0.3%-0.6% of patients treated with XIFAXAN[3,41]
- Did not cause any clinically relevant antibiotic resistance after 1 to 3 treatment cycles[42]

ALT, alanine aminotransferase; NA, not available.

*Most of the events of ALT increase were due to transient increases that resolved over time and were not temporally associated with study drug treatment.[3]

IMPORTANT SAFETY INFORMATION ***(continued)***

- *Clostridium difficile*-associated diarrhea (CDAD) has been reported with use of nearly all antibacterial agents, including XIFAXAN, and may range in severity from mild diarrhea to fatal colitis. If CDAD is suspected or confirmed, ongoing antibiotic use not directed against *C. difficile* may need to be discontinued.

Please see additional Important Safety Information throughout and click here for full Prescribing Information.

XIFAXAN has a straightforward prior authorization (PA) process

The XIFAXAN PA process is a simple way to help your adult patients diagnosed with IBS-D gain access to the treatment you prescribe

When a PA is required, be sure the following information is included and accurate:

- **Approved dosing for IBS-D:** #42 XIFAXAN 550-mg tablets, 3 times a day by mouth for 2 weeks[1]
- **Accurate indication of IBS-D:** **K58.0, the ICD-10 code for IBS-D[43,*]**
- **Age:** 18 years or older[1]
- **Previous therapies tried and failed** (eg, antidiarrheals, antispasmodics, loperamide, SSRIs, TCAs, and other OTC medications)

Click here to download the *Write it Right* flashcard

Remember to check for accurate and complete prescribing in EHR/EMR and on Rx, and consider XIFAXAN 550 mg for your system's EHR preference list or favorites. For PA support for XIFAXAN, go to **covermymeds.com** or call **1-866-452-5017**.

Initiate PAs in office vs awaiting pharmacy initiation when necessary

- In general, PAs proactively generated by prescribers had a higher dispense rate than PAs initiated by pharmacies[44]

98% of commercially insured patients have coverage for XIFAXAN[45,*,†]

100% of Medicare Part D patients have coverage for XIFAXAN[45,*,†]

*See ICD-10 code disclaimer on page 12.
†Formulary status subject to change.

IMPORTANT SAFETY INFORMATION *(continued)*

- There is an increased systemic exposure in patients with severe (Child-Pugh Class C) hepatic impairment. Caution should be exercised when administering XIFAXAN to these patients.

Dosing XIFAXAN: 2 weeks of treatment delivered lasting relief*of multiple symptoms[1-3]

Most treatments manage symptoms with continuous daily therapy, but XIFAXAN is different[1,46,47]

One 550-mg tablet 3 times a day with or without food[1]

2 weeks of treatment, not continuous, daily prescription medication[1]

Patients who complete initial treatment can be **retreated up to 2 times** for recurrence[1]

Provides relief of multiple IBS-D symptoms: abdominal pain, diarrhea, bloating, and urgency[1,2,36,37]

XIFAXAN STRONG RECOMMENDATION 2020 ACG Guidelines

Have you heard?

XIFAXAN was given a strong recommendation‡ to treat global IBS-D symptoms in the 2020 ACG Clinical Guideline on Managing IBS[5,§]

§Based on a moderate quality of evidence.¶

*In studies, more patients taking XIFAXAN vs placebo had IBS-D symptom relief the month following 2 weeks of treatment. Median of 10 weeks (range 6-24 weeks) of abdominal pain and diarrhea relief.[1,2]

†The ICD-10 code and all other patient-access–related information are provided for informational purposes only. It is the treating physician's responsibility to determine the proper diagnosis, treatment, and applicable ICD-10 code. Salix Pharmaceuticals does not guarantee coverage or reimbursement for the product.

‡Strength of recommendation: Strong=Most patients should receive the recommended course of action. Conditional=Many patients should have this recommended course of action, but different choices may be appropriate for some patients.[5]

¶Summary of quality of evidence: High=The estimate of effect is unlikely to change with new data. Moderate=The estimate of effect is uncertain.[5]

IMPORTANT SAFETY INFORMATION *(continued)*

- Caution should be exercised when concomitant use of XIFAXAN and P-glycoprotein (P-gp) and/or OATPs inhibitors is needed. Concomitant administration of cyclosporine, an inhibitor of P-gp and OATPs, significantly increased the systemic exposure of rifaximin. In patients with hepatic impairment, a potential additive effect of reduced metabolism and concomitant P-gp inhibitors may further increase the systemic exposure to rifaximin.

#1 prescribed medication approved for IBS-D[4,*]

2 WEEKS OF XIFAXAN TREATMENT provided **LASTING RELIEF** of abdominal pain and diarrhea[1-3,†,‡,§]

Is now a good time? Click here to watch our commercial

*Based on aggregated total of all prescribers as of August 2024.[4]

†In TARGET 1 and TARGET 2, adequate relief of global IBS-D symptoms over 10 weeks post treatment. In TARGET 3, no recurrence of diarrhea/abdominal pain was observed in a proportion of open-label responders. Median time to recurrence was 10 weeks, range of 6 to 24 weeks.[1-3]

‡Patients who experience recurrence can be retreated up to 2 times.[1]

IMPORTANT SAFETY INFORMATION ***(continued)***

- In clinical studies, the most common adverse reactions for XIFAXAN in IBS-D (≥2%) were nausea (3%) and ALT increased (2%).

REDUCE THE REPEAT

Disrupt the pattern of overt hepatic encephalopathy (OHE) episodes with XIFAXAN[1]

AASLD GUIDELINES
GRADE I,A,1
HIGHEST POSSIBLE RECOMMENDATION

XIFAXAN earned the highest possible recommendation (GRADE I,A,1) by the AASLD/EASL as an add-on therapy to lactulose to reduce the risk of OHE recurrence after a patient has a recurrence while on lactulose alone.[2,*]

INDICATION

XIFAXAN® (rifaximin) 550 mg tablets are indicated for the reduction in risk of overt hepatic encephalopathy (HE) recurrence in adults.

IMPORTANT SAFETY INFORMATION

- XIFAXAN is contraindicated in patients with a hypersensitivity to rifaximin, rifamycin antimicrobial agents, or any of the components in XIFAXAN. Hypersensitivity reactions have included exfoliative dermatitis, angioneurotic edema, and anaphylaxis.

Please see additional Important Safety Information throughout and click here for full Prescribing Information.

AASLD, American Association for the Study of Liver Diseases; EASL, European Association for the Study of the Liver.

*Per the GRADE System for Evidence: Grade 1=randomized, controlled trials; A=evidence is "high quality," and further research is very unlikely to change our confidence in the estimated effect; and 1=recommendation is "strong," with factors influencing strength of recommendation including the quality of evidence, presumed patient-important outcomes, and costs.[2]

Xifaxan® rifaximin 550 mg tablets

CHRONIC LIVER DISEASE (CLD) AND CIRRHOSIS ARE A GROWING PROBLEM[3]

Diabetes/cerebrovascular disease (stroke)

CLD and cirrhosis had **greater mortality in patients aged 25 to 54** than diabetes or cerebrovascular disease (2019)[4]

CLD and cirrhosis were the **10th leading cause of death** in the US in 2022[5]

45% increase in total number of CLD-related hospitalizations from 2005 to 2017[6,*]

*Rates per 1000 persons.

Patients with CLD/decompensated cirrhosis who have portal hypertension have a higher risk of complications, such as[7,8]:

Varices

Ascites

Hepatic encephalopathy (HE)

HE is a primary complication of cirrhosis[2]

UP TO 80% of patients with cirrhosis will eventually develop some form of HE[2]

The guidelines for portal hypertension and cirrhosis call for consideration of the totality of decompensation symptoms when evaluating cirrhosis and setting goals of therapy.[8]

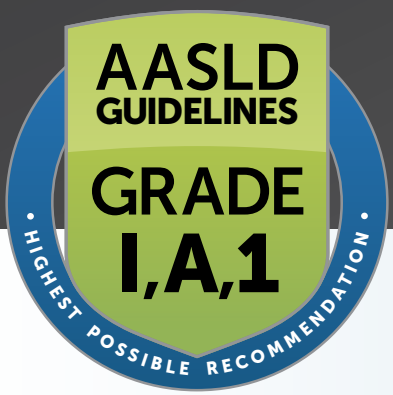
Please see additional Important Safety Information throughout and click here for full Prescribing Information.

XIFAXAN WAS GIVEN THE HIGHEST POSSIBLE RECOMMENDATION BY THE AASLD/EASL[2]

Xifaxan® rifaximin 550 mg tablets

Align with the guidelines by using the only FDA-approved agent indicated for the reduction in risk of OHE recurrence in adults[1]

XIFAXAN earned the highest possible recommendation (GRADE I,A,1) by the AASLD/EASL as an add-on therapy to lactulose to reduce the risk of OHE recurrence after a patient has a recurrence while on lactulose alone.[2]



I,A,1 is the highest possible recommendation[2]

GRADE I: Proven in randomized, controlled trials

GRADE A: Evidence is "high quality," and further research is very unlikely to change our confidence in the estimated effect

GRADE 1: Recommendation is "strong," with factors influencing strength of recommendation including the quality of evidence, presumed patient-important outcomes, and costs

IMPORTANT SAFETY INFORMATION *(continued)*

- *Clostridium difficile*-associated diarrhea (CDAD) has been reported with use of nearly all antibacterial agents, including XIFAXAN, and may range in severity from mild diarrhea to fatal colitis. If CDAD is suspected or confirmed, ongoing antibiotic use not directed against *C. difficile* may need to be discontinued.

XIFAXAN CUT THE RISK OF OHE RECURRENCE AND HE-RELATED HOSPITALIZATIONS IN HALF[1,9]

Xifaxan® rifaximin 550 mg tablets

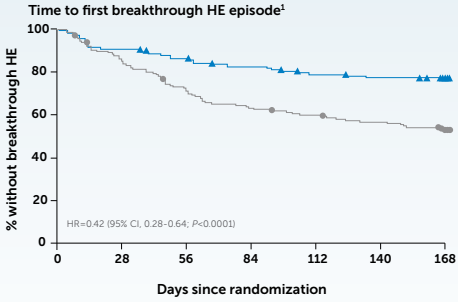
In a clinical trial of adults with OHE

Efficacy was observed early during treatment

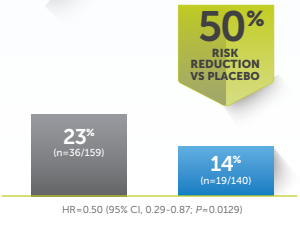
Primary Endpoint — OHE recurrences during 6 months of treatment*

HR=0.42 (95% CI, 0.28-0.64; *P*<0.0001)

Time to first breakthrough HE episode[1]

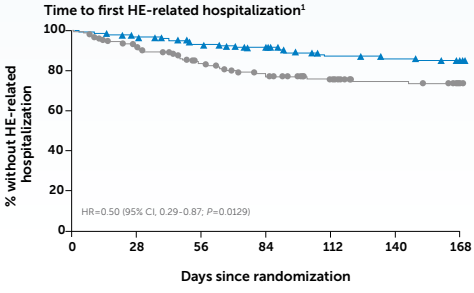


Key Secondary Endpoint — HE-related hospitalizations during 6 months of treatment



HR=0.50 (95% CI, 0.29-0.87; *P*=0.0129)

Time to first HE-related hospitalization[1]



91% of patients in the placebo and XIFAXAN groups were on lactulose[1]

Study design[1,9]

- In a randomized, placebo-controlled, double-blind, multicenter, multinational, 6-month study, the efficacy of XIFAXAN 550 mg (taken orally twice a day) was evaluated in 299 adult patients
- **Inclusion criteria:** Currently in remission (Conn score of 0 or 1) from HE and ≥2 episodes of HE associated with chronic liver disease in the previous 6 months
- **Primary endpoint:** Time to first breakthrough OHE episode, defined as a marked deterioration in neurological function and an increase in Conn score to grade ≥2 or an increase in Conn score and asterixis grade of 1 each if patient entered study at grade 0
- **Key secondary endpoint:** HE-related hospitalization

XIFAXAN number needed to treat (NNT)[9]

Condition	Therapy	To Prevent One	NNT
OHE	XIFAXAN 550 mg + background lactulose†	OHE episode in 6 months	4
		HE-related hospitalization in 6 months	9

*Comparison of Kaplan-Meier estimates of event-free curves showed XIFAXAN significantly reduced the risk of HE breakthrough by 58% during the 6-month treatment period.[1]

†91% of patients in the XIFAXAN group were on concomitant lactulose.[1]

IMPORTANT SAFETY INFORMATION *(continued)*

- There is an increased systemic exposure in patients with severe (Child-Pugh Class C) hepatic impairment. Caution should be exercised when administering XIFAXAN to these patients.

Please see additional Important Safety Information throughout and click here for full Prescribing Information.

A DEMONSTRATED SAFETY PROFILE[1]

Xifaxan® rifaximin 550 mg tablets

Trial 1 safety data (occurring in ≥10% of patients)

Common Adverse Reactions	XIFAXAN (N=140), n (%)	Placebo (N=159), n (%)
Peripheral edema	21 (15%)	13 (8%)
Nausea	20 (14%)	21 (13%)
Dizziness	18 (13%)	13 (8%)
Fatigue	17 (12%)	18 (11%)
Ascites	16 (11%)	15 (9%)

Adverse reactions that occurred in ≥5% but <10% of patients receiving XIFAXAN and greater than in patients who received placebo: muscle spasms, pruritus, abdominal pain, anemia, depression, nasopharyngitis, abdominal pain upper, arthralgia, dyspnea, pyrexia, and rash.

Trial 2 safety data (occurring in ≥10% of patients)*

Common Adverse Reactions	XIFAXAN + lactulose (N=108), n (%)	XIFAXAN (N=113), n (%)
Peripheral edema	15 (14%)	19 (17%)
Insomnia	15 (14%)	13 (12%)
Ascites	14 (13%)	8 (7%)
Diarrhea	13 (12%)	6 (5%)
Nausea	11 (10%)	17 (15%)
Muscle spasms	11 (10%)	9 (8%)
Constipation	9 (8%)	18 (16%)
Fatigue	9 (8%)	16 (14%)
Urinary tract infection	9 (8%)	13 (12%)
Pruritus	6 (6%)	11 (10%)
Anemia	3 (3%)	11 (10%)

Adverse reactions that occurred in ≥5% but <10% of patients receiving XIFAXAN in either treatment group: dyspnea, anxiety, abdominal pain, decreased appetite, headache, cough, renal failure acute, vomiting.

*Trial 2 safety data described above reflect randomized patient exposure to XIFAXAN + lactulose or XIFAXAN monotherapy in an open-label, active-controlled, multicenter, 6-month trial in adults with hepatic encephalopathy.

IMPORTANT SAFETY INFORMATION *(continued)*

- Caution should be exercised when concomitant use of XIFAXAN and P-glycoprotein (P-gp) and/or OATPs inhibitors is needed. Concomitant administration of cyclosporine, an inhibitor of P-gp and OATPs, significantly increased the systemic exposure of rifaximin. In patients with hepatic impairment, a potential additive effect of reduced metabolism and concomitant P-gp inhibitors may further increase the systemic exposure to rifaximin.

ACCURACY MATTERS: CORRECTLY PRESCRIBE XIFAXAN FOR THE REDUCTION IN RISK OF OHE RECURRENCE IN ADULTS[1]

Xifaxan® rifaximin 550 mg tablets

One 550-mg tablet, twice daily—no dose adjustments or titrations needed[1]

- There is an increased systemic exposure in patients with severe (Child-Pugh Class C) hepatic impairment. Caution should be exercised when administering XIFAXAN to these patients

Can be taken **with or without food**[1]

Can be continued for as long as patient is at risk of recurrent OHE[1]

When prescribing XIFAXAN, use the ICD-10 code for OHE: **K76.82** (Hepatic encephalopathy; indicate lactulose history if applicable)[10].*

XIFAXAN
550 mg
One tablet twice daily
#60 tablets
for the
reduction in risk
of OHE recurrence
K76.82*
5 refills

XIFAXAN can be used alone or in combination with lactulose.[1]

*The ICD-10 code and all other patient-access–related information are provided for informational purposes only. It is the treating physician's responsibility to determine the proper diagnosis, treatment, and applicable ICD-10 code. Salix Pharmaceuticals does not guarantee coverage or reimbursement for the product.

IMPORTANT SAFETY INFORMATION *(continued)*

- In clinical studies, the most common adverse reactions for XIFAXAN (alone or in combination with lactulose) were:
  - HE (≥10%): Peripheral edema (17%), constipation (16%), nausea (15%), fatigue (14%), insomnia (14%), ascites (13%), dizziness (13%), urinary tract infection (12%), anemia (10%), and pruritus (10%)
- INR changes have been reported in patients receiving rifaximin and warfarin concomitantly. Monitor INR and prothrombin time. Dose adjustment of warfarin may be required.
- XIFAXAN may cause fetal harm. Advise pregnant women of the potential risk to a fetus.
